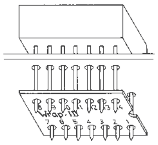
Socket Wrap I.D.



- Press fit to socket pins
- Improves wiring speed
- Instant pin numbering
- Reduces wiring errors
- Large space for user information
- Simplifies troubleshooting

Now offering an exciting, low cost item used to identify pin numbers on wire-wrapping sockets. Consisting of a socket-sized plastic panel with numbered holes in the pin location, the Socket Wrap-ID is simply slipped onto the socket before wrapping.

You can also write on them for easy identification of location, IC part number, function, etc. These unique items greatly simplify both initial wire-wrapping and subsequent troubleshooting or repair.

A great help to hobbyists, technicians, and production facilities alike.

Single In-Line Strip Sockets — Solderless Press Fit, Compliant Tail

FEATURES:

Unique compliant tail pins conforms to .040" ±.003" (1.02mm ±08mm) finished hole diameter without stressing inner layers.

APPLICATION OF COMPLIANT TAIL PINS:

Mill-Max's patented (Patent No. 4,799,904) compliant tail features precision machined pins that are hollow and slotted to conform to a .040" ±.003" (1.02mm ±08mm) diameter PTH. As the pin is inserted, the slot compresses to fit the PTH, thus avoiding damage (see illustration). The pin's tail has fine serrations that form a perfect "gas tight" connection that doesn't require soldering. And since the pin doesn't damage the hole, compliant tail sockets and connectors can be easily replaced.

Anti-Static IC Pin Straightener:
Straightens IC legs with one squeeze. Put .300" (7.62mm) ICs in one side of tool, and .600" (15.24mm) in other side of tool. This brings leads into tolerance .320" (8.13mm) or .620" (15.75mm).

Note: This tool does not straighten IC legs that are bent to such an extent that the pin-to-pin spacing is not .100" (2.54mm).

A999-ND Dip Extractor:
An extremely handy, low cost tool for removing ICs from dip sockets.

Quad Flat Pack (QFP) to PGA Adapters

Fig. 1

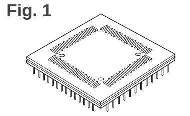

Fig. 2

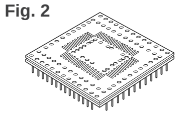

Adapters convert surface mount type Quad Flat Pack (QFP) packages to standard pin grid array through-hole packages on .100" (2.54mm) pin spacing. This allows the surface mount QFP package to be used in standard PGA and PGA ZIF sockets, which is extremely useful for testing. Typically, surface mount QFP packages are less expensive than their through-hole PGA counterparts. The surface mount packages are often more readily available. Also, the user does not have to redesign a through-hole board in order to utilize the advantages of the surface mount QFP packages.

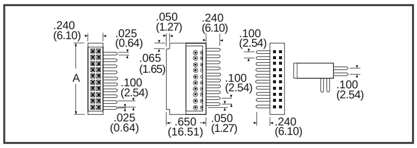
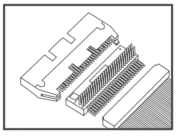
3M Intra-Connector™





When you wanted to test for a problem that might lie on the circuit board or in the cable, you had a problem. Inaccessible? Not with a 3M ESP Intra-Connector™ system. The Intra-Connector mates in-line with standard double row socket connectors. It has one set of female contacts, but two sets of male contacts at right angles. So, it provides instant line-by-line "probe-ability." The pins can also be used to make daisy chaining possible from a single connector cable end. Modified configurations are quickly available for special connections. The Intra-Connector system provides both straight-in and right angle functions. It mates with a standard .10" x .10" (2.54mm x 2.54mm) dual row connector or PC board-mounted .025" (.64mm) square pins. Two Intra-Connector systems used with the Intra-Switch™ system form a complete test assembly for probing signals under no load and full-load conditions. Contacts are non-corrosive Alloy 770; body is glass-filled polyester thermo-plastic.

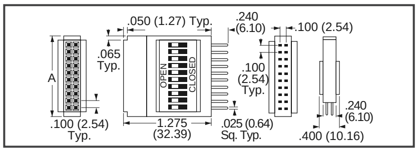
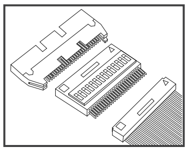
3M Intra-Switch™





There are a lot of complicated, time consuming ways to interrupt a signal line on an assembly — some may even be damaging to your PC board. But there's one easy way; Intra-Switch™ from 3M ESP. Simply by inserting the Intra-Switch™ connector between mating system connectors you have instant line-by-line switching. The low profile design and recessed switch buttons give you room to work in confined areas. Using a pencil or probe tip, any or all switches may be actuated. Applications include switching command signals to or from test equipment and programming optional preset logic functions. Switch buttons are recessed to prevent accidental switching. "Open" and "closed" positions are clearly marked, molded-in the body. Contacts are non-corrosive Alloy 770; body is glass-filled polyester thermoplastic. Intra-Switch is compatible with most sockets and headers for flat cable, including 3M, T&B/Ansley, Berg, Amp, Symbex and many others.

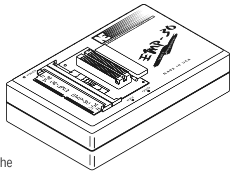
EMP-30 Programmer



Programs: EPROMS, Gals, Microcontrollers, PLD, Flash, EEPROMS, Serial EEPROMS.

The EMP-30 is an advanced universal programmer that supports digital voltages from 1.8 Volts to 7 Volts and analog voltages (such as VCC) from 0 to 25 volts. The EMP-30 provides near-theoretical programming times for most devices currently available. The EMP-30 is the fastest, most reliable and most versatile programmer in the EMP line. It supports more device types with larger pin counts than the smaller units in the EMP line, and changing Family Modules is not required as often. The socket module on top of the EMP-30 is removable, allowing different modules to be plugged in to accommodate different device packages. This helps eliminate the confusion often caused by third party adapters. The EMP-30 comes standard with a 48-pin DIP Socket Module and thirteen Family Modules. The unit contains three microprocessors, and automatically performs self-test and calibration verification upon power-up.

Contents: EMP-30 Programmer: 48-pin ZIF Socket Module: 110 VAC Power Transformer: 13 Family Modules: Parallel Port Cable: Printed Manual/User's Guide.

System Requirements: IBM-Compatible PC (386+)with 640Kb of RAM: Hard disk with at least 6Mb of free space: Standard parallel port.

XILINX

Programmable Gate Arrays

FPGA (Field Programmable Gate Arrays)

9282B-ND	Programmable Logic Data Book............ **$1.95**

A Technical Overview: Every Xilinx FPGA performs the function of a custom LSI circuit, like a gate array, but the Xilinx device is user-programmable and even reprogrammable in the system. Xilinx sells standard off-the-shelf devices in many different sizes, speeds, operating temperature ranges, and packages. The user selects the appropriate Xilinx device, and then converts the design idea or schematic into a configuration data file, using the Xilinx development system software and loads this file into the Xilinx FPGA.

XC3000/XC3100 • Replaces TTI, MSI, and other PLD logic • Toggle rates of 70 to 125 MHz, delays from 9 to 5.5. ns • Unlimited reprogrammability

XC3000A • Five device types (1300-7500 gates) • 4-input look-up tables • Flip-flop toggle rate over 110 MHz • No on-chip RAM, data storage limited to flip-flops • Use for medium speed, medium complexity applications

XC3100A • Functionally and bitstream identical with XC3000A series • Five device types (1300-7500 gates) • 4-input look-up tables • No on-chip RAM, data storage limited to flip-flops • Use for high performance design, system clock up to 100 MHz

XC4000/XC4000A • Benefits of custom CMOS VLSI • Gate ranges from 2,000 to 20,000 • Unlimited reprogrammability

XC4000E • Ten device types (2,000-25,000 gates) • Dedicated carry network • Function generator can be used as RAM • Use for general purpose logic and data-path logic

XC4000L • Low voltage version of XC4000E devices (3.0-3.6V)

XC4000EX • Larger version of the XC4000E family (28,000-125,000 gates) • Increased routing resources • Faster clocking options, more versatile output logic • Use for designs beyond 20,000 gate complexity

XC4000XL • Low voltage version of the XC4000EX devices (3.0-3.6V)

XC5200 • Low cost FPGA • Dedicated carry structure (no RAM) • Four-input function generators • Use for general purpose logic and data-path logic

XILINX XC9500 In-System Programmable CPLDs (Complex Programmable Logic Devices)

The XC9500 CPLD family provides advanced in-system programming and test capabilities for high performance, general purpose logic integration. All devices are in-system programmable for a minimum of 10,000 program/erase cycles. Extensive IEEE 1149.1 (JTAG) boundary-scan support is also included on all family members.

The XC9500 family is fully pin-compatible allowing easy design migration across multiple density options in a given package footprint. Advanced system features include output slew rate control and user-programmable ground pins to help reduce system noise. I/Os may be configured for 3.3V or 5V operation. All outputs provide 24mA drive.

CPLDs (Complex Programmable Logic Devices)

Atmel offers a broad range of high-density, low-power, and cost-effective solutions enabling designers to create products that are "just what the market ordered." Based on a standard architecture, which uses industry standard development tools, Atmel's CPLDs offer the unique low-power or "L" feature while providing 100% connectivity. These devices are processed with Atmel's proprietary 0.65-micron processes.

The ATF750/C CPLDs are based on a 22V10-type architecture and provide market-leading capacity and flexibility in a 22V10 footprint with twice the registers and additional features for better logic utilization.

The ATV2500/B OTP CPLDs offer 24 I/O pins, 48 registers, 17 product terms per macro, and 100% connectivity.

The ATF1500 Series is targeted at wider logic density, with higher number of I/O's. This family has devices from 44 to 160 pins, and 32 to 96 I/O's. High connectivity, and flexible architecture make these parts highly suitable for system design. In system programmability in the larger devices allow for reconfiguration even after the device is in the system.

Standard Development Tools

Atmel's philosophy is that designers should be able to use known development tools. Third-party design tools such as Synario™, ABEL™, CUPL™, PPLDesigner-XL™, LOG/iC™, and PLDSyn™ support Atmel's EPLDs. Also Atmel-specific versions of the popular Synario, ABEL, and CUPL design tools are offered. In addition, workstation support is available on popular platforms with Viewlogic, MINC, Cadence, Mentor, and Synopsys.

FPGA's (Field Programmable Gate Arrays)

AT40K SERIES FPGAs

Atmel's AT40K Series coprocessor FPGAs range from 5K to 50K usable gates, and are designed for high density, compute-intensive DSP and other fast logic designs. The AT40K family solves the Logic vs. SRAM trade-off problem by providing fast, flexible, distributed 10ns FreeRAM™ without using valuable logic resources. Structured logic functions, including variable array multipliers can be implemented directly in core cells without using any bussing resources - providing dramatic improvements in speed, utilization, power and system cost.

The AT40K family has the ability to implement Cache Logic design, where part of the FPGA can be reprogrammed without loss of register data, while the remainder of the FPGA continues to operate without disruption. This is ideal for building adaptive filters, variable coefficient multipliers and other designs where the datapath can change to increase system performance.

All Atmel FPGAs can be designed using industry standard CAE tools for schematics, VHDL and Verilog on a PC, Sun, or HP workstation. Software tools are available on Atmel's website at: http://www.atmel.com/fpga_software.html

Features:

- Distributed, single/dual port 10ns SRAM, independent of logic cells
- Up to 384 PCI compliant I/Os
- Mixed 3V/5V capability
- Architecture optimized for efficient, ultrafast array multipliers
- Cache Logic® dynamic full/partial reconfigurability in-system
- Eight global clocks
- Efficient, industry-standard design tools, optimized for synthesis
- QuickChange™ tools for adaptive hardware designs
- Variety of surface mount packages
- All devices in family are pin-compatible

AVR 8-Bit RISC FLASH Microcontrollers

Atmel's new AVR microcontrollers have a RISC core running single cycle instructions and a well-defined I/O structure that limits the need for external components. Internal oscillators, timers, UART, SPI, pull-up resistors, pulse width modulation, ADC, analog comparator and watch dog timers are some of the features you will find in AVR devices. AVR instructions are tuned to decrease the size of the program whether the code is written in C or Assembly. With on-chip in-system programmable Flash and EEPROM, the AVR is a perfect choice in order to optimize cost and get product to the market quickly.

The AVR is a low-power CMOS 8-bit series of microcontrollers based on the AVR RISC architecture. By executing powerful instructions in a single clock cycle, they achieve throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed. The AVR core combines a rich instruction set with the 32 general purpose working registers. All 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrolllers.

General Features: • Utilizes the AVR high-performance and low-power RISC architecture • 118 powerful instructions – most single clock cycle execution (89 instructions in AT90S1200 Series) • 32 x 8 general purpose working registers • Programming Lock for Flash program and EEPROM data security • Low-power idle and power down modes • External and internal interrupt sources • Low-power, high speed CMOS process technology • Fully static operation

Winbond Electronics Corporation America

Single-Chip Voice Record/Playback Devices

General Description: Winbond's patented ChipCorder® technology is a revolutionary multilevel technique to record and play back sound on a single chip. The advanced technology provides natural sound reproduction, in a cost-effective device that retains stored messages in the event of power loss or battery replacement.

The technology, based on a unique multilevel storage approach, stores multiple voltage levels into previously binary, two level EEPROM memory cells. Unlike traditional voice solutions whereby voice is digitized, the Winbond approach stores analog signals directly into single cells as one of over 250 levels.

All ChipCorder products integrate the oscillator, microphone pre-amplifier, automatic gain control, anti-aliasing filter, smoothing filter, and speaker amplifier on-chip to achieve a complete "system on a chip." Only a microphone, speaker, power source, and a few passive components are needed to implement a complete record/playback function.

ISD1100 Series **Description:** The ISD1100 has been designed for low-cost consumer applications where a bare die is mounted directly to the PC board. The inclusion of pull-up or pull-down resistors on the input pins minimizes the number of signals used and the number of external components or bonding wires required. **Features:** • Pushbutton interface • 5 volt operating range • Automatic power-down

ISD1200 Series **Description:** The ISD1200 offers a simple push-button interface coupled with the automatic power-down feature. It offers full addressability to handle multiple messages on a single chip. It is ideal for toy applications. **Features:** • 5 volt operating range • Automatic power-down • Fully addressable to handle multiple messages

ISD1400 Series **Description:** The ISD1400 expands on the simple push-button interface of the ISD1200, with longer storage durations of 16 and 20 seconds. It offers full addressability to handle multiple messages on a single chip and is widely used in communication and consumer applications. **Features:** • 5 volt operating range • Automatic power-down • Fully addressable to handle multiple messages

ISD2500 Series **Description:** The ISD2500 family offers improvement in speech length up to a maximum of 90 seconds. This extends the single-chip voice solution to industrial and high-end consumer applications. This family offers sound capability for new applications such as cellular phones, answering machines, voice-response faxes, copy machines and industrial applications where voice prompting provides product differentiation for equipment and manufacturers. **Features:** • 5 volt operating range • Fully addressable to handle multiple messages • Directly cascadable for longer durations • Automatic power-down (push-button mode)

ISD33000 Series **Description:** The ISD33000 ChipCorder Series provides high-quality, 3-volt, single-chip Record/Playback solutions for 1- to 4-minute messaging applications which are ideal for cellular phones and other portable products. The CMOS devices include an on-chip oscillator, anti-aliasing filter, smoothing filter, AutoMute™ feature, audio amplifier, and high density, multilevel storage array. The ISD33000 series is designed to be used in a microprocessor- or microcontroller-based system. Address and control are accomplished through a Serial Peripheral Interface (SPI) or Microwire Serial Interface to minimize pin count.

ISD4002 / ISD4003 Series **Description:** The ISD4000 series provides high-quality, 3-volt, single-chip record/playback solutions for 2 to 4 minute (ISD4002) and 4 to 8 minute (ISD4003) messaging applications. These CMOS-based devices include an on-chip oscillator, anti-aliasing filter, smoothing filter, AutoMute™ feature, audio amplifier, and high density, multilevel Flash storage array. **Features:** • Single +3 volt supply • Low-power consumption • AutoMute feature to provide background noise attenuation • Fully addressable to handle multiple messages • On-chip clock source • Microcontroller SPI or Microwire™ Serial Interface

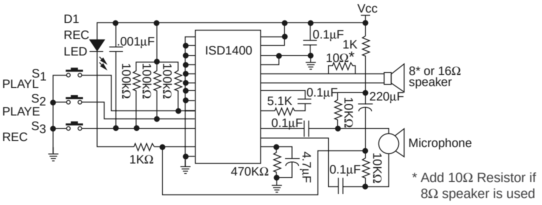
ISD-ES001 Evaluation System **Description:** The ISD-ES001 Evaluation System is a multi-purpose evaluation and development tool for use with Winbond's line of single-chip voice record/playback devices. As an evaluation tool, the ISD-ES001 enables designers to record and play back recordings using simple front-panel controls. The system's ease-of-use features facilitate comparisons of speech and sound quality relative to duration for each of these products. **Features:** • Combination evaluation system and emulation tool • Permits evaluation of speech/sound quality for different durations of Winbond devices • Documentation includes system schematic, Application Design Manual, step-by-step instructions for system use and explanation for use of three operation modes: Multiple message addressing; Looping on single message; Multiple message record/playback • Supports message-prompting applications and development • System includes: Telephone handset and jack; AC adapter jack; Audio in/out jacks; Cable for direct pin connections for microprocessor and microcontroller based applications

ISD-ES002 "Parrot"™ Demonstration Board **Description:** The ISD-ES002 Parrot Demonstration Board is a hand-held unit with a built-in socket allowing easy and immediate record and playback of Winbond devices. The ISD-ES002 system includes a speaker, a 9-volt battery with power supply regulation, and an ISD1416AP.

ISD-ES302 Demonstration Board for ISD33000 Series **Description:** The ISD-ES302 Demonstration Board is a portable unit designed to allow listeners to hear the high voice quality of ISD33000 Series products and to demonstrate the features available through the SPI control bus. The ISD-ES302 system includes: a demonstration board; a speaker (16 ohm); two AA batteries (1.5 volts each); an NSC COP820C microcontroller (on-board); an ISD1000A audio chip (on-board); an ISD33120P, an ISD33150P, an ISD33180P, and an ISD33240P device.

Voice quality better than "telephone quality" (telephones cut off below 300 Hz) is achieved with a sampling frequency of 8 KHz. The high frequency cut-off of the low pass filter is then chosen to be 3.4 KHz, satisfying the Nyquist criterion, but still with a wide enough frequency band to allow for good quality voice reproduction.

Application Example



* Add 10Ω Resistor if 8Ω speaker is used

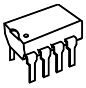
MICROCHIP KeeLoq® Code-Hopping Algorithm Encoders and Decoders



The Microchip KeeLoq family of code-hopping encoders and decoders offer a low cost, high security solution for security products such as garage door openers, alarm systems, and remote keyless entry systems.

KeeLoq is based on a code-hopping algorithm which provides Rock Solid Security. They use a programmable 64-bit encryption key that is unique to each device to generate 32-bit code-hopping code. The key length and hopping code combination reduces the possibility of unwanted access, due to code grabbing and code scanning, to essentially zero.

The KeeLoq encoders work with any of the decoders. They feature on-chip, error corrected EEPROM for non-volatile operation and, therefore, reduce the required components normally external to the encoder. The only additional circuitry required are push buttons, battery, and RF circuitry.

The KeeLoq decoders are single-chip solutions that employ normal and secure learning mechanisms, and operate over a wide voltage range. Microchip decoders are also full-featured, with serial interface to PICmicro microcontrollers, allowing designers to integrate the decoder with system functionality.

The KeeLoq family of products can be programmed with the KeeLoq Evaluation Kit or with the Pro Mate II Universal Programmer.

Encoder Features:

The HCS200 offers 3 inputs for up to 7 functions and it has a 28-bit serial number. It uses PWM for its output modulation. The HCS201 adds a step-up voltage regulator.

The HCS300 and HCS301 each have 4 inputs for up to 15 functions and add an LED output. The HCS300 runs on 2.0-6.3V while the HCS301 works from 3.5-13.0V. The HCS320 shares the same basic features of the HCS301 but adds a shift key input.

The HCS360 and HCS361 offer an even higher level of security by using a 48-bit seed and selectable 28/32-bit serial number. They offer 4 inputs for up to 15 functions. In addition to PWM, the HCS360 can modulate using the Manchester format and the HCS361 can modulate using VPWM.

Decoder Features:

All three decoders feature secure learning, auto bit rate detection, PWM input decode, and serial interface for PICmicro communication.

The HCS512 is an 18-pin device that can learn 4 different transmitters and has 4 binary function output pins.

The HCS500 is an 8-pin device that can learn up to 7 different transmitters, has an internal oscillator, and has 1Kbits of user EEPROM.

The HCS515 is a 14-pin device with the same features as the HCS500 plus 2 binary function output pins.

Programmer and Evaluation Kit

The KeeLoq Evaluation Kit demonstrates the capabilities of Microchip's code-hopping technology. It includes everything you need to program and test the KeeLoq encoders and decoders. Kit includes: • Software and License disk • Programmer board for programming encoders and decoders • HCS512 and PIC16C56/93C46 EEPROM based decoder and RF based receiver module • PDIP transmitter: can be used for the HCS200, HCS300, HCS301, HCS320, HCS360, HCS361 in sample kit • HCS300 SOIC transmitter • Power supplies and cabling

SENSORY

Voice Direct™ 364 Speech Recognition Kit

Bring life to consumer electronics, toys, motors, appliances, lights, and games through the power of VoiceActivation™!

Sensory's Voice Direct™ 364 Speech Recognition Kit delivers state-of-the-art technology in an affordable, easy to assemble module. This kit is an easy-to-use tool for adding voice recognition to a range of applications limited only by your imagination.

The Voice Direct™ 364 is a speaker-dependent speech recognition module, allowing training of up to 15 words (capable of being organized into 1 to 3 command sets). Using sophisticated speech recognition technology, Voice Direct™ 364 maps spoken commands to system control functions. Each time one of the words is recognized, output pins on the module are toggled high for 1 second. With proper use, greater than 99% recognition accuracy can be achieved.

New Continuous Listening Technology is "always on" — meaning no button press is required! Up to 3 "gateway" words can be programmed, each allowing access to 5 commands. In addition, the Voice Direct™ 364 technology builds on the original Voice Direct™ by offering even greater accuracy, faster response times, and improved noise immunity. Minimal programming and effort required.

Features: • Minimal external components • Recognizes up to 15 words or phrases • Over 99% recognition accuracy • Phrase recognition up to 2.5 seconds • User-friendly speech prompting • Quick setup time

Kit Contains: • Voice Direct™ 364 Module • Microphone element • Speaker (2.25", 8 ohm) • Microswitches (4 pieces) • Passive component selection to configure the module • Quick Setup Guide

Additional Required Tools and Components: • Power Source (4.5-5.25V @ 100mA, three 1.5 alkaline batteries recommended) • Soldering iron • Multimeter • 0.1" M/F headers • 3" x 3" proto or perf board • Hookup wire

MICROCHIP

8-Bit RISC Microcontrollers

PIC16C5X and PIC16HV540 Series

General Description: Microchip's long history of innovation has proven its commitment to develop and market leading edge products. With its PIC, Microchip has engineered *the most advanced low-to mid range 8-Bit Microcontroller family on the market today*. The flexibility of CMOS OTP EPROM Technology, the superior performance of RISC Architecture and the smallest packaging combined with affordable pricing are the prime reasons systems designers select PIC as their Microcontroller of Choice. With PIC, the 8-12 week lead time typical of ROM MCUs is reduced to just days. In addition, PIC's code compaction factor takes weeks off system design time. PIC's small die size combined with Microchip's advanced CMOS technology, support a *wide performance range* and low operating and standby currents. Low currents are ideal for long-life battery dependent applications. One of PIC's strongest suits is its I/O capability.

PIC16C5X (Use Programmer PICSTART Plus)

Features: Only 33 single word instructions to learn • All single cycle instructions (200 ns) except for program branches which are two-cycle • 12-bit wide instructions • 8-bit wide data path • 512 - 2K x 12 on-chip EPROM program memory • 25 to 73 x 8 general purpose registers (SRAM) • 7 special function hardware registers • 2 level deep hardware stack • Direct, indirect and relative addressing modes for data and instructions • 8 bit real time clock/counter (RTCC) with 8-bit programmable prescaler • Oscillator start-up timer • Watchdog timer (WDT) with its own on-chip RC oscillator.

PIC16C54C (Use Programmer PICSTART Plus)

Features: The PIC16C54C expands the baseline family with a low end device that offers lower power consumption and enhanced electrical characteristics. The PIC16C54C provides a cost reduction path for PIC16C57 and PIC16C58B users that require less program memory or data memory for a new application. Also some current PIC16C54, 54A, and 54B users may migrate to the PIC16C54C to enjoy the advantages of lower power consumption and enhanced electrical characteristics all at a lower cost. Software is supported from the PIC16C54 directly to the PIC16C54C with no software code changes. The PIC16C54C is equipped with special microcontroller-like features that reduce system cost and power requirements. There are four oscillator configurations to choose from, including power saving LP (Low Power) oscillator and cost saving RC oscillator.

PIC16HV540 (Enhanced PIC16C54 EPROM-Based 8-Bit CMOS Microcontroller with On-Chip Voltage Regulator)

General Description: The PIC16HV540 is a low-cost, high-performance, 8-bit, fully-static, EPROM-based CMOS microcontroller. It is pin and software compatible with the PIC16C5X family of devices. It employs an RISC architecture with only 33 single word/single cycle instructions. The PIC16HV540 is the first One-Time-Programmable (OTP) microcontroller with an on-chip 3 Volt and 5 Volt regulator. This eliminates the need for an external regulator in many applications powered from 9 Volt or 12 Volt batteries or unregulated 6 Volt, 9 Volt or 12 Volt mains adapters. The PIC16HV540 is ideally suited for applications that require very low standby current at high voltages. These typically require expensive low current regulators.

The PIC16HV540 is equipped with special features that reduce system cost and power requirements. The Power-On Reset (POR) and Device Reset Timer (DRT) eliminate the need for external reset circuitry. There are four oscillator configurations to choose from, including the power-saving LP (Low Power) oscillator, cost-saving RC oscillator, and XT and HS for crystal oscillators. Power saving SLEEP mode, Watchdog Timer and code protection features improve system cost, power and reliability.

Applications: The PIC16HV540 is very versatile even in areas where no microcontroller use has been considered before (e.g., timer functions, replacement of "glue" logic in larger systems, coprocessor applications). The PIC16HV540 fits perfectly in low-power battery applications such as CO and smoke detection, toys, games, security systems and automobile modules.

Features: • High-Performance RISC CPU • 18-pins • 12 I/O • 512 EPROM • 25 RAM • Only 33 single word instructions to learn • All instructions are single cycle (200 ns) except for program branches which are two-cycle • Operating Speed: DC - 20 MHz clock input; 200 - ns instruction cycle • 12-bit wide instructions • 8-bit wide data path • Seven special function hardware registers • ***Four-level deep hardware stack*** • Direct, indirect and relative addressing modes for data and instructions. **Peripheral Features:** • 8-bit real time clock/counter (TMR0) with 8-bit programmable prescaler • Power-On Reset (POR) • Brown-Out Protection • Device Reset Timer (DRT) with short RC-oscillator start up time • Programmable Watchdog Timer (WDT) with its own on-chip RC oscillator for reliable operation • Sleep Timer • ***8 High Voltage I/O*** • ***4 Regulated I/O*** • Wake up from SLEEP on pin change • Programmable code-protection • Power saving SLEEP mode • Selectable oscillator options: RC – Low-cost RC oscillator; XT – Standard crystal/resonator; HS – High speed crystal/resonator; LP – Power saving, low frequency crystal • Glitch filtering on master clear and pin change inputs. **CMOS Technology:** • ***Selectable on-chip 3V/5V Regulator*** • Low-power, high-speed CMOS EPROM technology • Fully static design • ***Wide-operating voltage range: 3.5V to 15V*** • Temperature range: Commercial: 0°C to 70°C; Industrial: -40°C to 85°C • Low-power consumption: <2mA typical @ 5V, 4 MHz; 15µA typical @ 3A, 32kHz; <4.5µA typical standby current @ 15V (with WDT disabled), 0°C t0 70°C.

PIC16C58B (Use Programmer PICSTART Plus)

Features: The PIC16C58B expands the baseline family support with a larger memory, small pin count device. The PIC16C58B provides upward migration path to PIC16C54 and PIC16C56 customers that require more program or data memory. In addition, PIC16C57 customers that do not require as much I/O capability can migrate down to 18 pins to save cost and board space. The PIC16C58B positions in the high-end of the baseline family between the PIC16C56 and the PIC16C57 providing the same memory capability of the PIC16C57 in the smaller 18 pin package. Only small code changes are necessary to interface to the I/O pins will be required The PIC16C58B is equipped with special microcontroller-like features that reduce system cost and power requirements. There are four user selectable oscillator configurations to choose from, including power saving LP (Low Power) oscillator and cost saving RC oscillator.

Maximum output current sinked by any I/O pin = 25mA; sourced by any I/O pin = 20mA. Do not exceed more than 800 mw of total power dissipation. EPROM = Erasable PROM; OTP= One Time Programmable Only

PIC16C505 14-pin PIC.

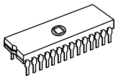
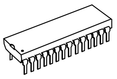
8-Bit RISC Microcontrollers

PIC16C6X Series





General Description:

The PIC16C6X is a family of low-cost, high-performance, CMOS, full-static 8-bit microcontrollers.

"A" Version parts have an additional brown-out detect circuit.

(Use Programmer PICSTART Plus)

All PIC16/17 microcontrollers employ an advanced RISC-like architecture. The PIC16CXX has enhanced core features, eight-level deep stack, and multiple internal and external interrupt sources. The separate instruction and data buses of the Harvard architecture allow a 14-bit wide instruction word with the separate 8-bit wide data. The two stage instruction pipeline allows all instructions to execute in a single cycle, except for program branches (which require two cycles). A total of 35 instructions (reduced instruction set) are available. Additionally, a large register set gives some of the architectural innovations used to achieve a very high performance.

PIC16C6X Microcontroller Core Features:

- High-Performance RISC CPU
- Only 35 single word instructions to learn
- All single cycle instructions except for program branches which are two-cycle
- Operating speed: DC - 20MHz clock input, DC - 200ns instruction cycle
- Interrupt capability
- Eight level deep hardware stack
- Direct, indirect and relative addressing modes • Power-on Reset (POR)
- Power-up Timer (PWRT) and Oscillator Start-up Timer (OST)
- Watchdog Timer (WDT) with its own on-chip RC oscillator for reliable operation
- Programmable code-protection
- Power saving SLEEP mode
- Selectable oscillator options

8-Bit CMOS Microcontroller with LCD Driver

PIC16C92X

(Use Programmer PICSTART Plus and AC164024-ND)

General Description:

The PIC16C9XX is a family of low-cost, high-performance, CMOS, fully-static, 8-bit microcontrollers with an integrated LCD Driver module, in the PIC16CXX mid-range family.

The **PIC16C923** devices have 176 bytes of RAM, 25 I/O pins, and 25-27 input only. In addition several peripheral features are available including: three timer/ counters, one Capture/Compare/ PWM module, one serial port and one LCD module. The Synchronous Serial Port can be configured as either a 3-wire Serial Peripheral Interface (SPI) or the two-wire Inter-Integrated Circuit (I^2C) bus. The LCD module features programmable multiplex mode (static, 1/2, 1/3 and 1/4) and drive bias (static and 1/3). It is capable of driving up to 32 segments and up to 4 commons. It can also drive the LCD panel while in SLEEP mode.

The **PIC16C924** devices have 176 bytes of RAM, 25 I/O pins, and 25-27 input only. In addition several peripheral features are available including: three timer/counters, one Capture/Compare/ PWM module, one serial port and one LCD module. The Synchronous Serial Port can be configured as either a 3-wire Serial Peripheral Interface (SPI) or the two-wire Inter-Integrated Circuit (I^2C) bus. The LCD module features programmable multiplex mode (static, 1/2, 1/3 and 1/4) and drive bias (static and 1/3). It is capable of driving up to 32 segments and up to 4 commons. It can also drive the LCD panel while in SLEEP mode. The PIC16C924 also has a 5-channel high-speed 8-bit A/D. The 8-bit resolution is ideally suited for applications requiring low-cost analog interface, e.g., thermostat control, pressure sensing, and meters.

Microcontroller Core Features:

• High performance RISC CPU • Only 35 single word instructions to learn • 4K x 14 on-chip EPROM program memory • 176 x 8 general purpose registers (SRAM) • 57 special function registers (60 for PIC16C924) • All single cycle instructions (500 ns) except for program branches which are two-cycle • Operating speed: DC - 8Mhz clock input; DC - 500ns instruction cycle • Interrupt capability • Eight level deep hardware stack • Direct, indirect and relative addressing modes

Peripheral Features:

• 25 I/O pins with individual direction control • 25-27 input only pins • Timer0: 8-bit timer/counter with 8-bit prescaler • Timer1: 16-bit timer/counter. Timer1 can be incremented during sleep via external crystal/clock • Timer2: 8-bit timer/counter with 8-bit period register, prescaler and postscaler

• One pin that can be configured a capture input, PWM output, or compare output:

• Capture is 16-bit, max. resolution 31.25ns • Compare is 16-bit, max. resolution 500ns • PWM resolution is 1- to 10-bits. Maximum PWM frequency @ 8-bit resolution = 32kHz, @ 10-bit resolution = 8kHz

• Programmable LCD timing module:

• Multiple LCD timing sources available • Can drive LCD panel while in Sleep mode • Static, 1/2, 1/3, 1/4 multiplex • Static drive and 1/3 bias capability • 16 bytes of dedicated LCD RAM • Up to 32 segments, up to 4 commons • Synchronous Serial Port (SSP) with SPI™ and I^2C™ • 8-bit multichannel Analog to Digital converter (PIC16C924 only)

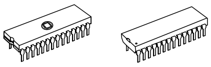
8-Bit RISC Microcontrollers

PIC16C62X / 16CE62X (EEPROM – Memory)



PIC16C62X
(Use Programmer PICSTART Plus or MP-PROG-ND)

General Description: The PIC16C62X are 18-pin EPROM-based members of the versatile PIC16CXX family of low-cost, high-performance, CMOS, fully-static, 8-bit microcontrollers. The PIC16C620 and PIC16C621 have 80 bytes of RAM. The PIC16C622 has 128 bytes of RAM. Each device has 13 I/O pins and an 8-bit timer/counter with an 8-bit programmable prescaler. In addition, the PIC16C62X add two analog comparators with a programmable on-chip voltage reference module. The comparator module is ideally suited for applications requiring a low-cost analog interface, e.g., battery chargers, threshold detectors, white goods controllers etc.

Features: **High-Performance RISC-like CPU:** • Only 35 single word instructions to learn • All single cycle instructions (200ns), except for program branches which are two-cycle • Operating speed: DC - 20MHz clock input, DC - 200ns instruction cycle • Interrupt capability • 16 special function hardware registers • 8 level deep hardware stack • Direct, Indirect and relative addressing modes.

Peripheral Features: • 13 I/O pins with individual direction control • 25mA sink/source per I/O for direct LED drive • Analog comparator module with: 2 analog comparators, Programmable on-chip voltage reference (VREF) module, Programmable input multiplexing form device inputs and internal voltage reference, Comparator outputs can be output signals • TMR0: 8-bit timer/counter with 8-bit programmable prescaler

Special Microcontroller Features: • Power-on-reset (POR) • Power-up Timer (PWRT) and Oscillator start-up timer (OST) • Brown-out protection • Watchdog timer (WDT) with its own on-chip RC oscillator for reliable operation • Programmable code protection • Power saving SLEEP mode • Fuse selectable oscillator options • Serial in-system programming (via two pins) • 4 user programmable ID locations

CMOS Technology: • Low-power, high-speed CMOS EPROM technology • Fully static design • Wide operating voltage range - 3.0V to 6.0V • Commercial and industrial temperature range • Low power consumption - < 2mA @ 5v, 4Mhz; 15µA typical @ 3V, 32KHz; < 1µA typical standby current @ 3V

MICROCHIP

High-Performance 8-Bit CMOS EPROM Microcontrollers

PIC17C4X, PIC17C75X, and PIC17C76X Series

PIC17C4X (Use Programmer PICSTART Plus)

Overview: All PIC16/17 microcontrollers employ an advanced RISC architecture. The PIC17CXX has enhanced core features, 16-level deep stack, and multiple internal and external interrupt sources. The separate instruction and data buses of the Harvard architecture allow a 16-bit wide instruction word with a separate 8-bit wide data. The two stage instruction pipeline allows all instructions to execute in a single cycle, except for program branches (which require two cycles). A total of 55 instructions (reduced instruction set) are available in the PIC17C42 and 58 instructions in all the other devices. Additionally, a large register set gives some of the architectural innovations used to achieve a very high performance. For mathematical intensive applications all devices have a single cycle 8 x 8 Hardware Multiplier.

Microcontroller Core Features: • Only 58 single word instructions to learn • All single cycle instructions (121ns) except for program branches and table reads/writes which are two-cycle • Operating Speed: DC - 33MHz clock input, DC - 121ns instruction cycle • Hardware Multiplier • Interrupt capability • 16 levels deep hardware stack • Direct, indirect and relative addressing modes • Internal/External program memory execution • 64K x 16 addressable program memory space

Peripheral Features: • 33 I/O pins with individual direction control • High current sink/source for direct LED drive: RA2 and RA3 are open drain, high voltage (12V), high current (60mA), I/O • Two capture inputs and two PWM outputs: Captures are 16-bit, max resolution 160ns, PWM resolution is 1- to 10-bit • TMR0: 16-bit timer/counter with 8-bit programmable prescaler • TMR1: 8-bit timer/counter • TMR2: 8-bit timer/counter • TMR3: 16-bit timer/counter • Universal Synchronous Asynchronous Receiver Transmitter (USART/SCI)

MCP2510 CAN Developer's Kit

Features: For an introduction to CAN, this tool can be used to demonstrate basic communication on a CAN bus via message transmission and reception. Messages are created on a host PC for transmission to the target board. As messages are sent or received, LEDs connected to the MCP2510 transmission pins toggle to show message traffic.

Push-button switches on the target board show how digital inputs are handled, while a potentiometer shows how to handle analog inputs via the CAN bus. In this manner, both the transmission and reception of messages can be easily demonstrated and understood.

MCP2510 software development is made easy by offering a variety of features designed to manipulate the functionality of the MCP2510. CAN messages are created and can be saved for later use and modification. Also, received messages are displayed in a separate window on the PC in a destuffed format to easily identify message contents. In addition, this tool provides the ability to read, display and modify all registers of the MCP2510. All of these features are designed to jump-start system designers' understanding of the MCP2510 and speed software development.

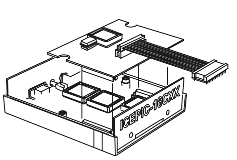
ICEPIC and ICEPIC2 PIC Emulators



ICEPIC and ICEPIC2 are fully modular, real time, in-circuit emulator systems, for use with Microchip 12CXX, 16CXX, and 17CXX processors, using interchangeable 'personality daughter-boards' which are sold separately. Both emulators are supplied with their own 32 bit operating software, but can also be used with Microchip's MPLAB™ development software.

System Requirements: IBM PC or compatible, VGA monitor, RS-232"C", 3.5" disk drive, and Microsoft Windows 3.1, Win 95, Win 98 or NT.

Both ICEPIC & ICEPIC2 are supplied as a complete system with power supply, cables, manual and a copy of Microchip's MPASM assembler. They both use the same windows software user operating environment (IDE) with a comprehensive GUI under Microsoft Windows software (also MPLAB™).

The emulator system is configured to handle the appropriate PIC microcontroller according to the personality daughter boards which are ordered separately. These daughter boards configure the emulator to handle specific devices from a wide range of PIC microcontrollers. This enables the user to adapt their ICEPIC system to support new PIC processors as they became available.

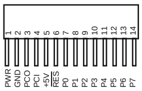
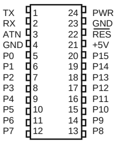
BASIC Stamp Modules

BS1-IC



BS2-IC, BS2E-IC, and BS2SX-IC



Stamp-Sized Modules Run BASIC

These modules are general-purpose I/O computers which are programmed in BASIC. The language set has instructions for interfacing with electronic circuitry including shift registers, integrated circuits that use SPI, solid state relays, or devices that use asynchronous serial protocols.

BS1-IC and BS2-IC: The BS1-IC has 8 I/O lines, program storage for 80 lines of BASIC code, 4MHz operation, and comes in a 14-pin SIP package. The BS2-IC has 16 I/O lines, program storage for 600 BASIC instructions, 20-MHz operation, and comes in a 24-pin DIP package. Both modules are perfect for small control applications. The modules require power from a regulated or unregulated voltage source from 5-12VDC. For ease in programming and prototyping, different types of boards are available for prototype development or permanent applications.

BS2SX-IC: Using Scenix SX microcontroller, the BS2SX-IC provides the highest speed, largest program memory, and fastest serial I/O in the BASIC Stamp family. Great solution for those needing more horsepower than a BS2-IC. **Features:** • Microcontroller: Scenix SX28AC/SS, • Speed: 50 MHz/10,000 instructions per sec. • EEPROM: 16K bytes (program and data in 8 x 2K program spaces) • Program Length: 4,000 lines of PBASIC • RAM: 32 bytes (6 for I/Os and 26 for variables) plus 63 bytes “scratch pad RAM” for interprogram sharing • Inputs/Outputs: 16 (up to 17 RS-232 communication ports) • Source/Sink Current: 30 mA/30 mA • Serial Communication: 305-115k baud I/O • Current Requirements: 60 mA running, 200 uA in sleep, • PC Interface: Serial port • Package: 24 pin DIP module

BS2E-IC: Using Scenix SX microcontroller, the BS2E-IC runs at the same speed as BASIC Stamp II, but has the RAM and EEPROM size benefits of the BS2SX, but without the speed and power consumption. Ideal for those who use the BS2 but would like more variable or program space.

Stamp Programming:

To get started programming BASIC Stamps you need a BASIC Stamp module, prototyping board (Carrier Board, Board of Education, or BASIC Stamp Activity Board), serial cable, and software (available for internet download and on the CD-ROM). Getting started is easiest with the BASIC Stamp I, II, or IISX Starter Kits.

System requirements: IBM PC or compatible, VGA monitor, parallel port (BS1-IC), serial port (BS2-IC, BS2SX-IC, or BS2E-IC), CD-ROM drive, DOS or Win98 operating system.

BASIC Stamp I Starter Kit: The BASIC Stamp I Starter Kit includes one BASIC Stamp I module, SuperCarrier Board, BASIC Stamp manual version 2.0, a Parallax CD-ROM (include software) and a parallel cable.

BASIC Stamp II Starter Kit: The BASIC Stamp II Starter Kit includes one BASIC Stamp II module, Board of Education, BASIC Stamp manual version 2.0, a Parallax CD-Rom (include software) and a serial cable.

BASIC Stamp IISX Starter Kit: The BASIC Stamp IISX Starter Kit includes one BASIC Stamp IISX module, Board of Education, BASIC Stamp manual version 2.0, a Parallax CD-ROM (include software) and a serial cable.

Board of Education “Full Kit”: The Board of Education “Full Kit” contains a Board of Education, BASIC Stamp II module, pluggable wires, serial cable, and power supply. The B.O.E. Manual is in PDF format on CD-ROM.

BASIC Stamp Super Carrier Board:

The Super Carrier Board provides wire-wrap/solder application space and holes placed to accommodate DIP ICs. The Super Carrier supports the BS1-IC and BS2-IC.

• 3” x 4” Double-sided plated through-hole prototype board • On-board voltage regulator accepts 6-30 VDC, from wall-pack or battery • 3-pin parallel (BS1-IC) and DB-9 serial ports (BS2-IC) are used for programming and run-time communication • Protoype area (1.5” x 2.0”) holes arranged to easily support servos, 300 and 600 mil DIP ICs, DB9, DB25, RJ-11 connectors • size measures 7.7 x 10.2 cm (3 x 4”).

Z8® Series Microcontrollers

Z8 MCU Family

Overview: Zilog MCU products are targeted for cost-sensitive, high-volume applications including consumer, automotive, security, and HVAC. One-time programmable (OTPs) for prototyping as well as volume production where time to market or code flexibility is critical. A variety of packaging options are available. The same on-chip peripherals are used across the MCU product line with the primary differences being the amount of ROM/RAM, number of I/O lines present, and packaging/temperature ranges available. This allows code written for one MCU device to be easily ported to another family member.

Features: • **General-Purpose Register (GPR) File Architecture:** Every RAM register acts like an accumulator, speeding instruction execution and maximizing coding efficiency. Working register groups allow fast context switching. • **Flexible I/O:** I/O byte, nibble, and/or bit programmable as inputs or outputs. Outputs are software programmable as open-drain or push-pull on a port basis. Inputs are Schmitt-triggered with auto latches to hold unused inputs at a known voltage state. • **Analog Inputs:** Three input pins are software programmable as digital or analog inputs. When in the analog mode, two comparator inputs are provided with a common reference input. • **Timer/Counter (T/C):** The T/C consists of a programmable 6-bit prescaler and 8-bit downcounter, with maskable interrupt upon end-of-count. • **Interrupts:** There are six vectored interrupt sources with software-programmable enable and priority for each of the six sources. • **Watch-Dog Timer (WDT):** An internal WDT circuit is included as a fail-safe mechanism so that if software strays outside the bounds of normal operation, the WDT will timeout and reset the MCU. • **Auto Reset:** All family devices have internal Power-On Reset. • **Low-EMI Operation:** Mode is programmable via software or as a mask option. This new option provides for reduced radiated emission via clock and output drive circuit changes. • **Low-Power:** CMOS with two standby modes; STOP and HALT. • **Full Z8 Instruction Set:** Forty-eight basic instructions, supported by six addressing modes with the ability to operate on bits, nibbles, bytes, and words.

Z8Plus™ Microcontrollers

Employing the experience gained from the industry-standard Z80 and Z8 cores, the Z8Plus offers increased functionality, significantly higher performance, lower power requirements, and greater cost savings over other 8-bit microcontrollers. The Z8Plus is designed to be easy to use, even for designers who have never used a microcontroller before.

With single-cycle execution, powerful I/O capabilities and register-to-register architecture, the Z8Plus offers state-of-the-art flexibility and freedom for any designer in search of a low-cost solution for a variety of microcontroller applications.

The Z8Plus core offers several significant advantages compared to the current Z8 core. Foremost is performance improvement due to a reduced system clock division and a fixed instruction cycle time. The improvement is nearly 50%, depending upon instruction mix. For example, a Z8Plus-based part at 10MHz has performance comparable to a 16MHz part in production today. This, along with significant design improvements, leads to lower power and lower noise operation.

The Z8PE002 and Z8PE003 microcontrollers are the newest members of the popular Z8E001 Z8 Plus 8-bit microcontroller family. New features include voltage brown-out protection and power-on reset. Additionally, the "RESET" pin has been replaced with a general purpose I/O pin and oscillator circuitry to support RC configurations. These new parts are targeted at customers who require a powerful, yet small OTP microcontroller for use in general purpose applications.

STATIC PROTECTION

Protection of static sensitive parts is a MUST in today's semiconductor market.
To ensure the quality that Digi-Key customers have come to expect,
the Digi-Key static control program includes proper static safety protection in the following areas:

- ***Receiving, Incoming Inspection, and QC***
- ***Order Picking***
- ***Final Inspection***
- ***Packaging and Shipping***

Shielded metalized bags are used in order picking, and anti-static, non-CFC, photo degradable packaging peanuts are used in packaging and shipping.

As our program is continuously updated with the latest static control technology, you can be reassured that Digi-Key's static sensitive parts are quality safe, *all the way to your door step!*

FAIRCHILD SEMICONDUCTOR — TinyLogic™

TinyLogic™ gives design engineers the ability to implement design changes or modify standard VLSI circuits without having to redesign complex silicon subcomponents or printed circuit board layouts. TinyLogic™ is primarily intended for use in space-constrained systems such as portable CD players, disk drives, cellular phones, pagers, radios, PCM-CIA cards and portable computers.

TinyLogic can facilitate efficient system designs in any application. Placement of single and dual gate logic functions exactly where needed simplifies signal routing while minimizing propagation delays and noise generation. Fairchild's TinyLogic™ family consists of a broad spectrum of high speed, low power, and CMOS single gate logic functions.

Products in the TinyLogic™, 7SZ parts (UHS Series) are the fastest logic devices on the market, operating in a Vcc voltage range of 1.8V to 5.5V.

In addition, with input overvoltage tolerance, the devices are capable of interfacing with 5V components while operating at 3V. 7S parts (HS Series devices) are intended for use with 5V applications, but will operate in a voltage range of 2V to 6V.

Series	Specified Power Supply	Compatibility Input VIL/VIH	Compatibility Output VOL/VOH	Drive IOL/IOH	Supply Current ICC	Speed TPD
7Sxx (HS)	2V - 6V	CMOS	TTL, CMOS	2.6mA/–2.6mA	10µA	21 ns
7SZxx (UHS)	1.8V - 5.5V	CMOS	TTL, CMOS	32mA/–32mA	20µA	4.5 ns

TinyLogic™ 7Sxx (HS Series)

Features	Benefits
CMOS (HS)	Compatible with HC
Low Quiescent Power: Icc < 1 µA @ 6V Vcc	Low power supply drain-beneficial for portables

JRC / NJR Corporation — VOLTAGE REGULATORS

TO-220F Full Molded Three Terminal Voltage Regulator

Full Molded Package, TO-220F was developed for high and medium power 3 pin linear voltage regulators. It is interchangeable with conventional TO-220, with the difference of radiation fin encapsulated completely by resin, offering the following benefits: • Ease of electrical isolation from nearby devices • Allowing higher density PCB layout • Increased humidity resistance compared to TO-220. • Enhanced manufacturability due to built-in electrical insulation from heat sink. *TO-220F has tinned leads for improved solderability.*

MICROCHIP CMOS LCD DRIVERS

The AY0438 is a CMOS LSI circuit that drives a liquid crystal display, usually under microprocessor control. The part acts as a smart peripheral that drives up to 32 LCD segments. It needs only three control lines due to its serial input construction. It latches the data to be displayed and relieves the microprocessor from the task of generating the required waveforms. • Drives up to 32 LCD segments of arbitrary configuration • CMOS, NMOS and TTL compatible inputs • Cascadable • On-chip oscillator • Requires only three control lines • Can be used to drive relays, solenoids, print head drives, etc.

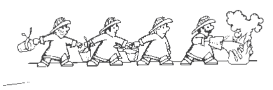
Panasonic BUCKET BRIGADE DEVICES



A P-channel silicon gate MOS LSI consists of a number of bucket brigade stages fabricated on a single chip. Each stage consists of a capacitor that stores the electrical charge and a tetrode transistor for switching purposes. Electrical charges corresponding to analog signals are transferred from one stage to another by a two phase clock drive. Thus the electric signals flow undirectionally from the input to the output with a time delay which can be controlled by the clock frequency. The Bucket Brigade Device has found a variety of applications in audio equipment as a useful equipment as a useful variable or fixed delay line. The device can obtain chorus and tremolo effects in electronic musical instruments as well as reverberation effects in audio equipment, which completely replaces conventional mechanical systems.

Antennas / Connectors

Antennas are a critical and often neglected factor in determining the range and reliability of any wireless link. Linx antennas are ideal for achieving maximum performance and cost efficiency from most discrete or modular designs. All antennas are designed to meet FCC and international standards.

LP Series: LP series antennas are low-cost, reduced height permanently attached 1/4-wave whips. They are ideal for applications requiring a rugged, cosmetically attractive, yet cost-effective antenna solution. The antennas are easily secured directly to a user's PCB via a single screw.

PW Series: Designed for permanent attachment, the PW series of 1/4-wave whip antenna is designed to offer outstanding performance in a rugged, cost-effective Part 15-compliant package. The antenna is attached by securing its base through a 1/4" hole in the product's package. The antenna is fed through the base via RG-174 (7" standard length) coax which may be soldered directly to a PCB or attached via a connector.

CW Series: The CW series antennas features an FCC Part 15-compliant Reverse Polarity SMA connector allowing for easy field replacement. These antennas deliver outstanding performance in a rugged and cosmetically attractive package.

RH Series - Reduced Height: Significantly smaller than our larger whips, the RH series is ideally suited for products where cosmetic or functional requirements dictate a compact, aesthetically pleasing antenna.

RA Series: The RA series offers maximum mounting and orientation flexibility in a cost-effective reduced height package. The antenna's innovative base allows a wide range of horizontal and vertical motions which enhances versatility for both the designer and the customer. The antenna mounts quickly to a PCB via a single screw and meets all Part 15 Requirements.

SP Series - The "Splatch": The Splatch uses a grounded line technique to extract outstanding performance from a tiny surface-mount element. Unlike many compact antennas the Splatch is highly immune to proximity effects making it an ideal choice for hand-held applications such as remote controls, pagers, and alert devices. This unique antenna is designed for hand or reflow mounting directly to a product's circuit board.

HD Series - Reduced Height: This reduced height 1/4-wave antenna is ready for years of abuse thanks to a highly flexible internal helical which is over-molded with a heavy-duty protective jacket. The HD series is an excellent choice for outdoor application, or for use in adverse environments where the antenna must resist shock, harsh weather, and tampering.

PMB Series: PMB series 1/4 wave antennas feature a soft blade type element which can be rotated 360°. A molded tab allows coding of the customers case to control the rotational travel.

GPS w/ SMA Connector: This sleekly housed active GPS antenna sets a new standard of value and performance. The antenna operates from 2.5 ~ 5.5 volts and consumes as little as 4mA. The unit's rugged housing is fully weatherized and may be mounted via its magnetic base or integral screw receptacles.

RCS Series - Ultra-Compact Right Angle: The RCS series is ideally suited for products requiring an attractive yet compact antenna in a right-angle form factor.

RCL Series - Compact Right Angle: Similar to the RCS series but in a larger form factor. It is useful in products where additional height above the product's case is needed or a slightly wider operational bandwidth is desired.

Dual Band Dome Antenna: This dome antenna is ideal for applications requiring both 824 to 894 MHz cellular and 1.575 GHz (GPS) reception. Each internal antenna has a 16.5' (5.03 meters) coaxial cable with a BNC connector for the 824 to 894 MHz cellular antenna and an SMA connector for the 1.575 GHz antenna. Mounting is accomplished via an adhesive pad and locking nut.

Panasonic® Hall Effect Sensor ICs

Panasonic's Hall IC is a combination of a Hall element, amplifier, Schmidt circuit, and stabilized power supply/temperature compensator integrated on an identical chip by using the IC technology. It amplifies Hall element output at the amplifier, converts into a digital signal through the Schmidt circuit, and drives the TTL or MOS IC directly.

Features: • Stable temperature characteristics due to the additional temperature compensator • TTL and MOS ICs directly drivable by output • Semipermanent service life due to no contact parts • Small change of the operating flux density against mechnical stress • Provided with the output pull-up resistors (typ 27kΩ or open collector output (see chart) • Operating Temperature:-40°C to 100°C (-40°C to 85°C for DN6851 - DN6853) • Supply Current Max: 6mA • Output Circuit Max: 20mA

Applications:
- Speed Sensors
- Position Sensors
- Rotation Sensors
- Keyboard Switches
- Microswitches

FEATURES:

On-Chip temperature compensation circuitry minimizes shifts in ON and OFF points and hysteresis over temperature and supply voltage. Ideal sensors for ignition timing, anti-lock brake systems, speed measurement, angular and linear measurement/positioning. Designed for use in hostile automotive and industrial environments.

SWITCHING SPECIFICATIONS:

Bipolar: Output turns low with magnetic south to branded side of package (open drain).

Unipolar: Output turns low with magnetic south to branded side of package, output turns high if magnetic field is removed.

Latching: Output turns low with magnetic south to branded side of package, output does not change states when magnetic field is removed.

Differential: Output determined by magnetic south pole flux density between 2 internal sensors, output low with B_{S1}-B_{S2}>B_{on}, output high with B_{S1}-B_{S2}<B_{off}.

Linear: The 2 outputs give a differential voltage that is analog to the magnetic flux density, south magnetic pole to branded side package yields V_{out1}<V_{out2}; north magnetic pole to branded side of package yields V_{out1}>V_{out2} (do not connect V_{out1} or V_{out2} to ground).

CHERRY

Solid State Magnetic Hall Effect Sensors

Cherry magnetic sensors are used to detect changes in magnetic field polarities and the motion of ferrous metals such as gear tooth movements. Used for such applications as speed and proximity sensing, magnetic polarity detection and current flow monitoring. Solid state design for unlimited life.

Features:

HE31-3500 magnetically biased bipolar digital latch. Extreme sensitivity. Internal transistor switches on when exposed to south pole and remains on until north pole magnetic field is introduced.

MP100701 is an aluminum threaded barrel sensor for speed and position sensing. The threaded barrel allows precise positioning and adjustment.

Fig. 2, 5, and 6 are barrel sensors intended for gear tooth speed sensing. High speed capability, ideal for sensing power gears, conveyer speed and other rotating gears. Built-in magnet supplies its own bias field. GS101202 is plastic housing with steel bushing.

Integrated Switching Regulators

Power Trends Products from Texas Instruments manufactures the industry's smallest, most efficient and easy to use Integrated Switching Regulators (ISRs). Using a unique, proprietary design which employs 1 MHz switching technology to produce state-of-the-art power densities, these ISRs let you select the product performance that exactly matches your application. **Features:** • Easy to use—just plug them in. In most cases, only one external component is required, if any • Output voltages are laser-trimmed for accuracy • High efficiencies and low component counts combine to yield MTBFs in excess of 1,000,000 hours

TOKO Low Dropout Voltage Regulators

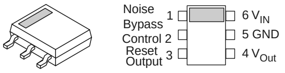
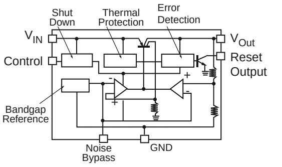
Series TK119

Features:

• Reset output for microprocessor • Very low dropout voltage • Very low quiescent current (no load) • Internal thermal/overload shutdown • Low noise voltage • Input and output voltage sense • ±2.5% output voltage accuracy • CMOS or TTL On/Off control • High speed On/Off transient (Typ. 50µs)





Description:

The TK119 series are low power linear regulators with on/off switch. Built-in voltage comparators provide a reset logic LOW level whenever the input or output voltage falls outside internally preset limits. The internal electronic switch can be controlled by CMOS or TLL levels. The device is in the OFF state when the control pin is biased HIGH. An internal PNP pass transistor is used to achieve a low dropout voltage (typically 200mV at 50mA load current). The device has a very low quiescent current (130µA) in the ON mode with no load and 2mA with 30nA load. The quiescent current is typically 4mA at 60mA load. The current consumption in the OFF mode is 65µA. An internal thermal shutdown circuit limits the junction temperature to below 150°C. The load current is internally monitored and the device will shut down (no load current) in the presence of a short circuit at the output. The output noise is very low at 10dB down from V_O when an external noise bypass capacitor is used. The TK119xx is available in a small SOT-23L surface mount package.

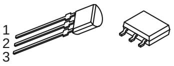
Low Saturation, Linear Regulator



Features: • Low dropout voltage • Low quiescent current • Very stable output • Extremely small package (SOT25) • Built-in output on/off control on 713xx • Noise reduction available on 712xx

Description: TK711xx/712xx/713xx series are low saturation, linear regulators used for applications with large supply voltage change. Since a PNP power transistor is used, dropout voltage is very low, making it possible to maintain a stable output voltage even as the battery voltage decreases. This allows longer battery operation. The TK711xx series is connected in a basic three terminal configuration. The TK712xx series has a noise bypass pin available. The TK713xx series has an on/off control pin only (a low level turns the output on). Since the current at the high level is extremely stable (12 µA type. at V_{IN} = 5 V), a smaller output capacitor can be used.

The TK711xx is available in a TO-92 package while the 712xx and 713xx are available in a very small SOT25 surface mount package.

Voltage Detectors

Highly Reliable, Easy-to-Use
CMOS LSI Is for Voltage Detection

The MN1380 Series is a series of devices with functions for: • Monitoring the power supply voltage supplied to microcomputers and to LSI systems • Generating the RESET signal for carrying out initialization when the power supply is turned ON • Preventing runaway in systems when the power supply voltage fluctuates. Recently, there has been an increase in the number of battery-driven products such as cordless telephones, notebook-type personal computers, etc. In these products, highly accurate monitoring of the power supply voltage is an important point in terms of system operation and data backup. While maintaining the voltage detection precision of similar voltage detection devices so far, the MN1380 Series of devices consumes 1/10 the current. In addition, users can choose from one of three output formats: CMOS output, N-ch open drain and inverted CMOS output.
